

Name:

# UI Replication Activity

**General Instructions:** Recreate the provided profile UI in Flutter, ensuring accurate UI replication, proper use of widgets, variable-based data, appropriate data types, image assets, and fallback values for missing data.

## Grading Criteria:

| Criteria                             | Description                                                                                                                 | Points    | Score |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------|-------|
| <b>UI Replication Accuracy</b>       | Accurately reproduces the provided game UI, including overall structure, positioning, proportions, and major elements.      | <b>30</b> |       |
| <b>Widget &amp; Layout Structure</b> | Correctly uses <b>Text</b> , <b>Column</b> , <b>Row</b> , <b>Card</b> , and appropriate layout widgets to construct the UI. | <b>20</b> |       |
| <b>Data Variables</b>                | All displayed data is declared as variables and uses appropriate data types.                                                | <b>20</b> |       |
| <b>Dynamic Data Display</b>          | Variables are properly connected to the UI so changing the data changes the displayed content.                              | <b>10</b> |       |
| <b>Fallback / Missing Data</b>       | Missing or unavailable data has appropriate fallback values or visuals instead of leaving a broken/empty UI.                | <b>10</b> |       |
| <b>Assets &amp; Images</b>           | Correctly uses project assets and displays the required images, preferably through image variables.                         | <b>5</b>  |       |
| <b>Styling &amp; Visual Details</b>  | Applies appropriate colors, typography, spacing, borders, cards, and other visual details from the reference.               | <b>5</b>  |       |

**Total**

**100**
